

Software Engineering in der industriellen Praxis (SEIP)

Dr. Ralf S. Engelschall

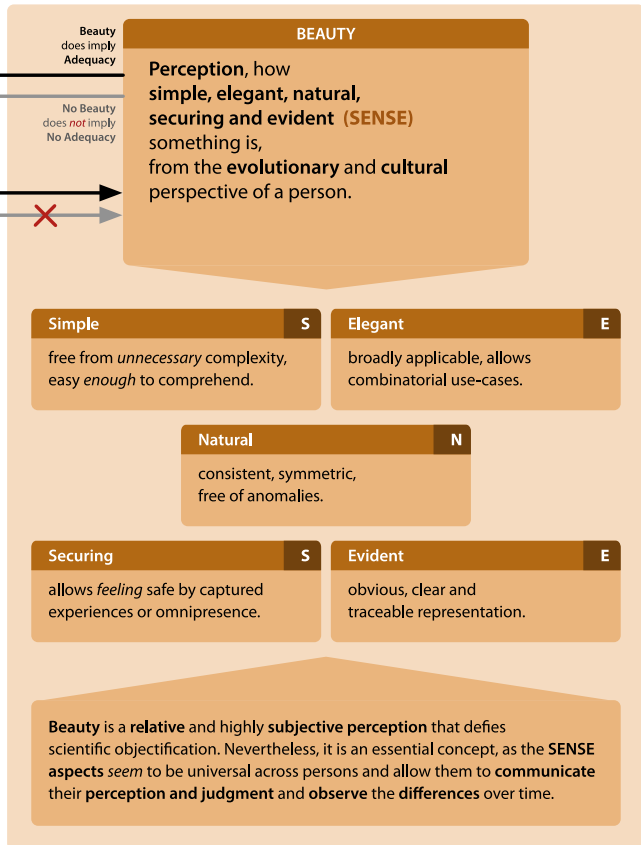

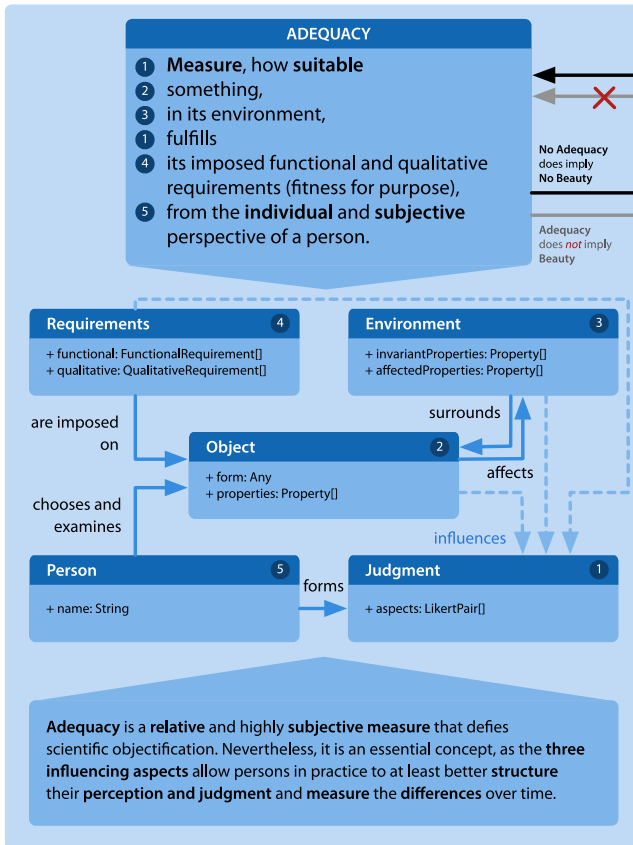

Architecture is not easy to define. You can define architecture both **structurally scientific** through measurable elements, interfaces and relationships, or also **wholly artistic** through "the harmony and the accord of all parts." The "truth" lies somewhere in practice in between, because the two extremes span a broad space, in which all solutions are located in practice.

On the structurally scientific side, architecture defines itself through the aspects **Science** (in particular Computer Science) and **Engineering** (especially Software Engineering). On the holistic artistic side, architecture defines itself through the aspects of **Craftmanship** (especially programming) and **Art** (especially User Experience).

Questions

- ❓ How to define **Architecture**?
- ❓ What are the four **Aspects of Architecture**?

Adequacy is defined as the measure, how suitable something, in its environment, fulfills its imposed functional and qualitative requirements (fitness for purpose), from the individual perspective of a person.

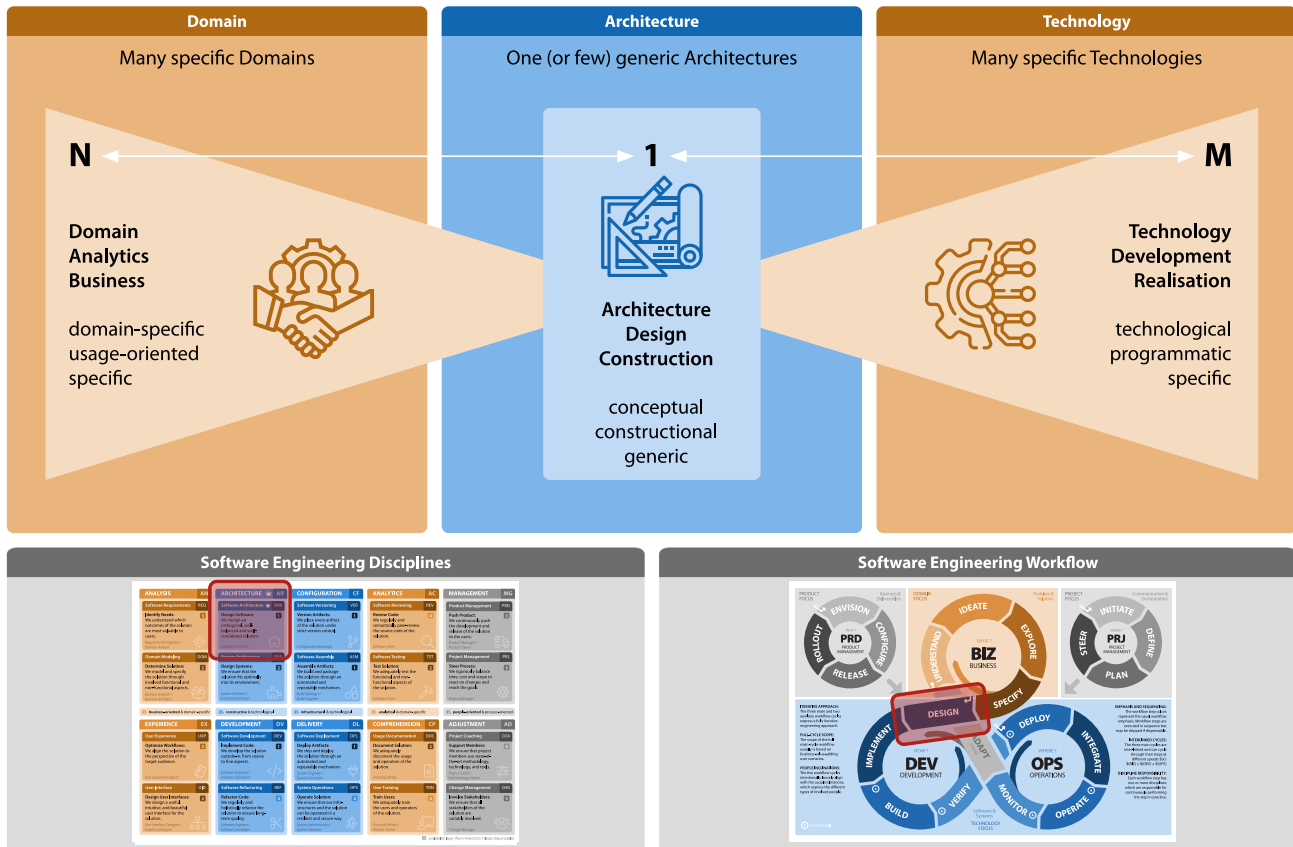

Adequacy is a relative and highly subjective measure that defies scientific objectification. Nevertheless, adequacy is an essential concept, as the three influencing aspects (Requirements, Environment, Object) allow persons in practice to at least better structure their perception and judgment and measure the differences over time.

Beauty is defined as the perception, how simple, elegant, natural, securing and evident (SENSE) something is, from the evolutionary perspective of a person.

Beauty is an absolute and highly subjective perception that defies scientific objectification. Nevertheless, beauty is an essential concept, as the SENSE aspects seem to be universal across persons and allow them to communicate their perception and judgment and observe the differences over time.

Questions

- ? Is it possible to measure Adequacy or Beauty in general?
- ? Is it possible to measure Adequacy or Beauty in the context of a single person?

(Software) **Architecture** is considered the “King Discipline” in **Software Engineering**, since it is the central, general, and conceptual link between the many, potential, specific, realized **Domains** and the many, potential, specific, realizing **Technologies**. The architectural construction of an application takes place in the logical step “Design” within the BizDevOps-workflow of Software Engineering.

Questions

- Why is **Architecture** considered the “King Discipline” of Software Engineering?

Manifesto for IT Architecture

Continuously Raising the Bar

Mission	As IT Architects we guide the design, implementation and evolution of IT solutions.
Entitlement	We continuously strive to raise the bar of professional IT architecture by practicing it and helping others to learn our craft. We achieve maximum value for our clients through our work.
Values	Through this work we have come to value aspects of our craft. While we acknowledge the beneficial values in the items on the right, we appreciate the stronger values in the items on the left even more.
Sustainable Concepts	over Latest Technologies
Pragmatic Making	over Theoretical Consideration
Constructive Craftsmanship	over Analytical Engineering
Accredited Creativity	over Achieved Industrialization
Proactive Improvement	over Reactive Correction
Inherent Quality	over Tested Robustness
Operational Delight	over Useful Functionality

The **Manifesto for IT Architecture** is a policy statement for IT architecture. First and foremost, it says to “Continuously Raising the Bar”, since after just 50 years of Software Engineering and Software Architecture even though we already know a number of best practices, the discipline will certainly have to continue to develop for a very long time.

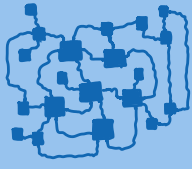

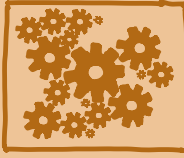

The Mission for IT architects is the design, implementation, and maintenance of IT solutions. The Entitlement is to continuously raise the bar and help others to learn the “craft.” Naturally is the fact that through the work of architects, the maximum added value is achieved for customers.

The basic values, which play a central role in this craft and which are greatly appreciated are: **Latest Technologies, Theoretical Consideration, Analytical Engineering, Achieved Industrialization, Reactive Correction, Tested Robustness and Useful Functionality.**

In addition, there are additional values, which also play a central role and are even more appreciated: **Sustainable Concepts** (the content of **Architecture Fundamentals!**), **Pragmatic Making, Constructive Craftsmanship, Accredited Creativity, Proactive Improvement, Inherent Quality and Operational Delight.**

Questions

? (none)

	complex	complicated
FOCUS	refers to the extrinsic and higher- or macro- level difficulty of a system,	refers to the intrinsic and lower- or micro- level difficulty of a system,
RATIONALE	because the system involves many different and connected parts	because the system involves many different and difficult aspects
CHALLENGE	which take time to comprehend and master in total ,	which take time to understand and learn in detail ,
INSIGHT	and which nevertheless are easy to explain.	and which usually are hard to explain.
		
	NOTICE Simple (non-complicated) systems can be complex .	NOTICE Clear (non-complex) systems can be complicated .
	RECOGNIZE Architecture primarily has to master the complex aspects of a system.	RECOGNIZE Development primarily has to master the complicated aspects of a system.

“Complex” refers to the extrinsic and higher- or macro-level difficulty of a system because the system involves many different and connected parts which take time to comprehend and master in total, and which nevertheless are easy to explain.

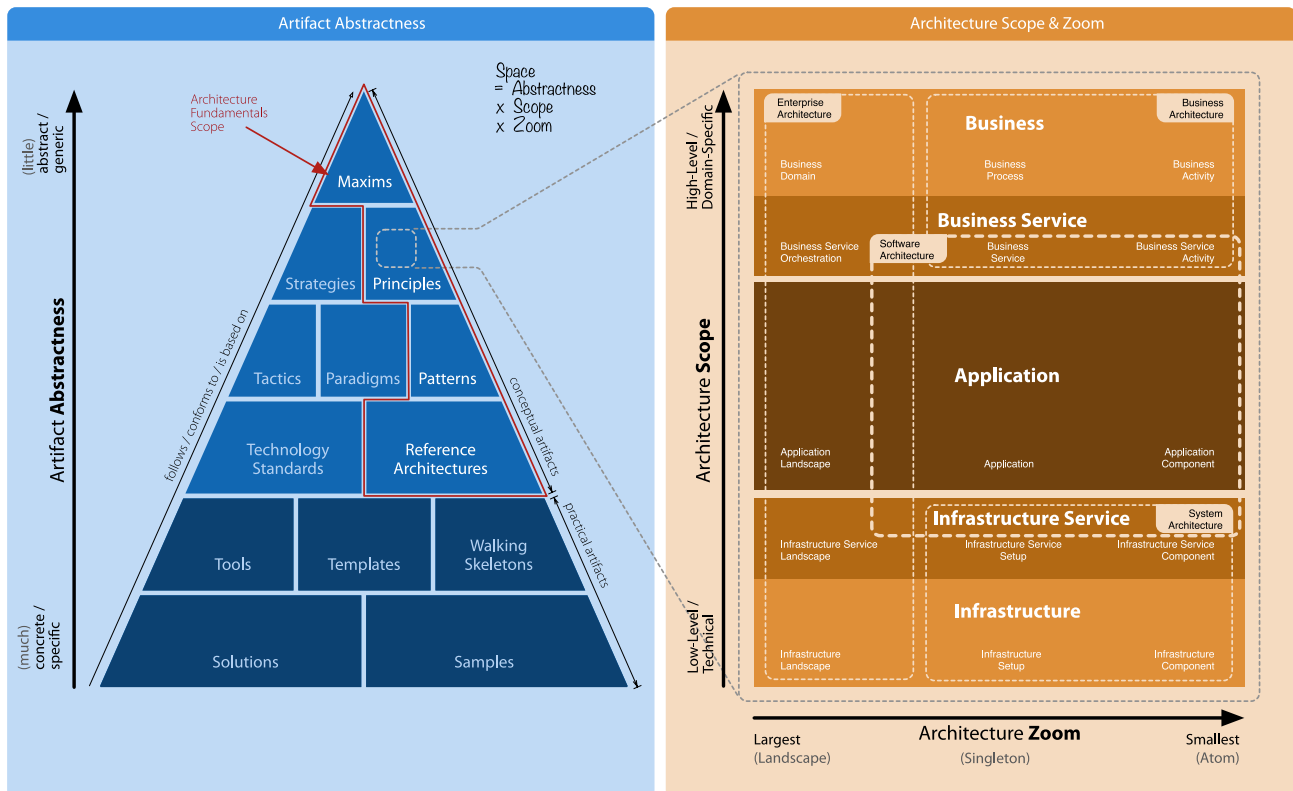

“Complicated” refers to the intrinsic and lower- or micro-level difficulty of a system because the system involves many different and difficult aspects which take time to understand and learn in detail, and which usually are hard to explain.

Note: Simple (non-complicated) systems can be complex – clear (non-complex) systems can be complicated.

The crucial difference is: The architecture or the construction has to master the complex aspects of a system. The development or realization has to master the complicated aspects of a system.

Questions

- ? Does **Architecture** primarily have to deal with **complex** or **complicated** aspects of a system?

The **IT Architecture Space** consists of three dimensions: the **Artifact Abstractness** (a degree of abstraction of all artifacts that are known by the architect), the **Architecture Scope** (the field of architecture, in which one acts) and the **Architecture Zoom** (the detail level of architecture in which one acts).

One primarily distinguishes between three Architecture Scopes: (high-level/domain-specific) **Business**, **Application** and (low-level/technical) **Infrastructure**. In addition, the two secondary Architecture Scopes **Business Service** and **Infrastructure service** are used to reduce in practice the “mental leap” from Business to Application and from Application to Infrastructure.

On each Architecture Scope, one can choose from at least three different **Architecture Zooms**: from **Landscape** (largest), over **Singleton** to **Atom** (smallest).

In the space of Architecture Scope and Zoom, one differentiates between four types of IT architecture: **Business Architecture, Software Architecture, System Architecture and Enterprise Architecture.**

The higher/lower the level of abstraction of the artifacts, the larger/smaller usually is the coverage of the room made from Architecture Scope and Architecture Zoom.

Questions

- ❓ The IT **Architecture Space** consists of which three dimensions?
- ❓ Which four types of Architecture are known in IT?

Requirement: A functional or non-functional demand or imposed obligation on the Subject .	Architecture: Inherent static and dynamic structure of a Subject which comprises Elements . The visible Behaviour of Elements and Relationships between Elements .	Maxim: Fundamental, generally valid set of values and rules to guide the architecture discipline (think: law).
Subject: Any type of business process, business service, software application, infrastructure service or infrastructure setup.	Element: Fundamental part from which a Subject can be constructed.	Strategy: Long-term situation-independent plan of approaches to achieve a particular goal (think: war). Aligned and not in conflict with any Maxims .
Stakeholder: Person, group or entity with an interest in or Concerns about the Architecture .	Behaviour: Run-time characteristic of Architecture Elements of the Subject .	Tactic: Short-term situation-dependent plan of actions to achieve a particular goal (think: battle). Following and supporting a Strategy .
Concern: Requirement, objective, intention, or aspiration a Stakeholder has on an Architecture .	Relationship: Static or dynamic relationship between Elements of an Architecture of the Subject .	Principle: Fundamental truth, rule, tenet or policy an Architecture follows.
Architecture Description: Set of artifacts that document an Architecture in a way Stakeholders can understand and ensures their Concerns are met.	Rationale: Fundamental reasons for a particular chosen Architecture , usually strongly based on non-functional Requirements .	Pattern: Proven recurring theme, structure, approach or behavior an Architecture and its Elements can follow.
Viewpoint: Collection of templates and conventions for constructing one type of View . It addresses Concerns and contains guidelines for constructing a View .	View: Representation of one or more structural aspects of an Architecture that illustrates how the Architecture addresses one or more Concerns .	Reference Architecture: Reusable proven Architecture template, based on a set of Patterns and following one or more Tactics and Strategies .
Perspective: Collection of decisions, guidelines and rules that ensure a Subject exhibits a set of non-functional Requirements , considered across a number of Views .	Aspect: Representation of one or more non-functional aspects of an Architecture that illustrate how the Architecture addresses one or more Concerns .	Scope: Primary area of the Architecture space an Insight addresses; either Business, Business Service, Application, Infrastructure Service or Infrastructure.
Insight: Superordinate abstract concept to address particular Concerns through Viewpoints and Perspectives .	Language: Formal, semi-formal or even prose language to describe an Insight , so it optimally addresses the Concerns of Stakeholders .	Zoom: Level of view distance to the Architecture an Insight has. Also known as the Insight detail level, ranging from smallest atoms, over singletons to the largest landscape.

Business Drives BD  Trigger and support the business with technological feasibilities, but always understand the business domain and its demands and align your architecture accordingly.	Component Orientation CO  Master complexity in your architecture through stringent bottom-up use of components on all scopes and zoom-levels, loose coupling between and strong cohesion within components.	Separation of Business and Technology BT  Strictly separate the business, i.e., domain-specific, aspects from the technological, i.e., infrastructural, aspects. Furthermore, ensure the explicit visibility of domain concepts.	Adequate Description AD  Provide as much stakeholder-directed architecture description as necessary, and as little as possible.
Use-Case Driven Design UC  Design is how it works and runs, so support your customers in their daily work by directly designing your architecture along their domain-specific use-cases.	Analytical and Creative Act AC  Recognize that every good architecture is based on both analytical engineering and creative artistic aspects.	Balance Principles Against Requirements PR  By weighing them against one another, find a reasonable balance between fundamental architecture principles and your particular non-functional requirements.	Insights through Views & Aspects VA  Give insights into your architecture through carefully selected stakeholder-directed separate views and aspects. Express each with the most suitable graphical or textual language.
Proven Basis PB  Never start an architecture from scratch. Instead start from proven reference architectures, patterns and templates. Even if after some iterations, no initial content is left.	Don't Be Too Clever TC  Don't be too clever or tricky, both in your higher-level architecture and lower-level design aspects.	Design for Failure Case DF  Murphy was an architect: everything which can fail will sometime ultimately fail. Hence, already design for the failure case (think: "pessimistic").	Continuous Compliance CC  Continuously check through qualitative inspections and quantitative measurements whether your architecture and the non-functional requirements are followed and do not drift apart.
No Silver Bullet SB  There is no "one-size-fits-all" architecture, so accept that although you should reuse proven architecture aspects as much as possible, you will always need to individualize your designs.	Simplicity Trumps ST  Create solution parts as simple as possible and only as complex as necessary. And remember: simplicity before generality, use before reuse!	Design to Change DC  Time changes everything, so your solution is already legacy at the first day of release. Hence, already design for its change (think: "agile").	Integration-Figure Architect IF  Recognize that you, the architect, are the central integrating figure, having to bridge between the business and technology spheres of people.
Stepwise Refinement SR  Start with the "big picture" and perform a stepwise top-down refinement of your architecture by going from coarse to fine aspects.	Perfect is the Enemy of Good Enough GE  Beware of the perfection pitfall and design your architecture only as good as necessary and not as good as ultimately possible.	Explicit Decisions ED  Record your major architecture decisions and rationales by taking into account and back-referencing the non-functional requirements.	Eat Your Own Dog-Food OF  Theory and practice usually differ. Hence it is vital that every architect has good hands-on experience and must both be able to craft the solution and is willing to hypothetically intensively use it himself.

In IT Architecture, one follows **Architecture Maxims**, which are basic guidelines. One knows 20 maxims. The architect should always follow the maxims and never break them.

Note: **Proven Basis** and **No Silver Bullet** say that one has to start an architecture always on a proven basis (e.g., a reference architecture), however, at the same time, it has to be clear that one cannot use these 1:1, but always first have to adjust it.

Note: **Stepwise Refinement** and **Component Orientation** say that regarding time (and for reasons of risk minimization), one always goes from the coarse to the fine, while the results show a stringent component-orientation, where small components are hierarchically integrated into larger components.

Note: while, as an IT architect, one just has to accept all maxims, **Simplicity Trumps** is from another quality: nothing in IT is really easy. When something looks simple, one just doesn't understand enough about it. Or someone really invested a lot just to make it look simple. **Simplicity Trumps** means precisely this: make inherently complex things simple again.

Questions

- For reasons of risk minimization, how should the IT architect at **Stepwise Refinement** always proceed step-by-step?
